

💡 LED_GLOW ✨

About :

A Led is added to Pluto Drone. We will make this LED glow at different brightness. Here we will see how to make led glow without delay function and explore further.

Add-On used :

A LED module can be used as an indicator or just a glowing-fading signal lamp. It is a simple LED attached to Pluto drone.

Components and Connection:

Pluto drone, LED module and connecting wires.

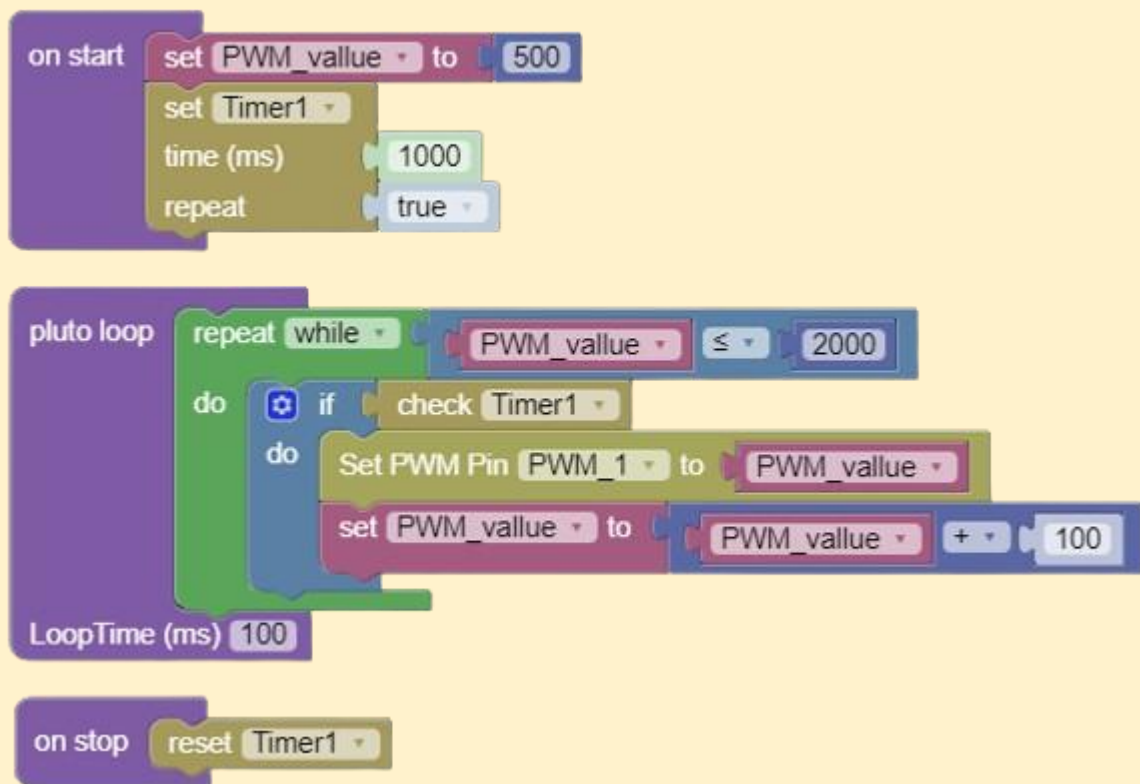

Connect the LED_module on the RC port of Primus V5/X2 board

Primus V5/X2 pin	Peripherals
GND on RC port	GND on LED_module
Signal on RC port	VCC on LED_module

How does it work?

In this project we add a utilise a timer and while loop to change the PWM signals provided to LED between different instance if times.

PlutoBlocks

Working:

Initially, we set Receiver mode as ESP

When loop starts, the timer flag turns on whenever specified amount of time is passed, we change the PWM value at the same time and it remains so, till next timer flag.

This creates a glowing effect of led to the viewer.

Moving further

TRY using a LED to make a Flying Torch, which can be used to explore areas with low light.
