

LASER_DETECTOR

About :

Pluto drone is equipped with a Laser detector canopy, which detects if Laser is shined on the canopy. If laser is shined on the it, then it takes off.

Add-On used :

A laser tag is a special canopy which has refractoral domb which accumulates the laser signal at a particular focus point in canopy. The focal point consists of a light sensor.

Components and Connection:

Pluto drone, Laser tag canopy and connecting wires.

Connect the Sound sensor on the RC port of Primus V5/X2 board

Primus V5/X2 pin	Peripherals
VCC on RC port	VCC on Laser tag
GND on RC port	GND on Laser tag
Signal on RC port	A0 on Laser tag

How does it work?

Think of the laser detector as light sensor which detects laser light specially:

- Normal reading → 1 = No_takeoff
- Laser light shining → 0 = Drone Take_off

PlutoBlocks

Select Receiver Mode Rx_ESP ▾

on start

on stop

Working:

Initially, we set Receiver mode as ESP

When loop begins, it start evaluating whether Laser light is shined on the PlutoDrone. If it is, it commands the drone to take off.

Moving further

Try tweaking the code to add laser landing feature as well.

Try making drone pass counter using laser.
